

CrimeVision: Advanced Crime Classification with Deep Learning

CrimeVision is a system that uses deep learning techniques to classify crime scenes and identify patterns in criminal behavior. It is an advanced crime classification system that uses computer vision and machine learning algorithms to analyze crime scenes and helps us to solve crime more faster with clues and evidences.

PAIN:
This model relies on data to make the predictions, so lack of data may lead to false predictions. And also limitations of machine learning algorithm, the model cannot classify the types of crimes. The cost and implementation is also major concern.

GAIN:
By doing this project we are happy and satisfied to make impact on the technological world. We learn how the law enforcement works and help them to identify patterns in crime scene
